Abstract

A thermally induced sound wave generating device comprising a thermally conductive substrate, a head insulation layer formed on one surface of the substrate, and a heating element thin film formed on the heat insulation layer and in the form of an electrically driven metal film, and wherein when the heat conductivity of the thermally conductive substrate is set as α_i and its heat capacity is set as C_i , and the thermal conductivity of the heat insulation layer is set as α_1 and its heat capacity is set as C_1 , relation of $1/100 \ge \alpha_1 C_1/\alpha_8 C_8$ and $\alpha_3 C_8 \ge 100 \times 10^6$ is realized. This is a new technical means capable of greatly improving the function of a pressure generating device based on thermal induction.
